Azure App Service is a **fully managed Platform-as-a-Service (PaaS)** used to host web applications, REST APIs, and mobile backends. It removes infrastructure management (IIS setup, OS patching, scaling, load balancing) so developers focus only on code.

Below is the complete process to **create an App Service** using the Azure Portal.

1. Log in to the Azure Portal

1. Open your browser.
2. Navigate to <https://portal.azure.com>
3. Sign in with your Azure credentials.

2. Navigate to “Create a Resource”

1. From the left-hand navigation, select **Create a resource**.
 2. In the search bar, type **App Service**.
 3. Choose **App Service** from the results.
 4. Click **Create**.
-

3. Fill in App Service Basic Details

On the **Basics** tab, complete these fields:

3.1 Subscription

Choose the Azure subscription where the app will be billed.

3.2 Resource Group

Choose an existing Resource Group or create a new one.

Example:

- Name: **RG-AppServices-Demo**

3.3 Instance Details

- **Name:** This becomes your site name and DNS.
Example: mywebapi-demo
URL will be: https://mywebapi-demo.azurewebsites.net
 - **Publish:** Choose one:
 - **Code** (for .NET, Node.js, Java, Python apps)
 - **Docker Container** (if deploying containerized apps)
 - **Runtime Stack:** Select your tech stack
Example: **.NET 8 (LTS)**
 - **Region:** Choose a region close to your users
Example: Central India, South India, East US
-

4. Configure the Hosting Plan (App Service Plan)

	FREE Try for free	SHARED Environment for dev/test	BASIC Dedicated environment for dev/test	STANDARD Run production workloads	PREMIUM Enhanced performance and scale	ISOLATED High-performance, security and isolation
Web, mobile or API apps	10	100	Unlimited	Unlimited	Unlimited	Unlimited
Disk space	1 GB	1 GB	10 GB	50 GB	250 GB	1 TB
Maximum instances	–	–	Up to 3	Up to 10	Up to 20	Up to 100*
Custom domain	–	Supported	Supported	Supported	Supported	Supported
Auto Scale	–	–	–	Supported	Supported	Supported
VPN hybrid connectivity	–	–	–	Supported	Supported	Supported
Network isolation						Supported

Create App Service Plan ...

Basics Tags Review + create

App Service plans give you the flexibility to allocate specific apps to a given set of resources and further optimize your Azure resource utilization. This way, if you want to save money on your testing environment you can share a plan across multiple apps. [Learn more](#)

Project Details

Select a subscription to manage deployed resources and costs. Use resource groups like folders to organize and manage all your resources.

Subscription * ⓘ

Resource Group * ⓘ

[Create new](#)

App Service Plan details

Name *

Operating System * ☒ Linux ☐ Windows

Region *

Pricing Tier

App Service plan pricing tier determines the location, features, cost and compute resources associated with your app. [Learn more](#)

Pricing plan

[Explore pricing plans](#)

Zone redundancy

An App Service plan can be deployed as a zone redundant service in the regions that support it. This is a deployment time only decision. You can't make an App Service plan zone redundant after it has been deployed. [Learn more](#)

Zone redundancy

☐ **Enabled:** Your App Service plan and the apps in it will be zone redundant. The minimum App Service plan instance count will be three.

☒ **Disabled:** Your App Service Plan and the apps in it will not be zone redundant. The minimum App Service plan instance count will be one.

[Review + create](#)

[< Previous](#)

[Next : Tags >](#)

It defines:

- Pricing tier
- Compute power (CPU, RAM)
- Autoscaling capability

Steps:

1. Click **Create new** under **App Service Plan**.
2. Enter plan name:
Example: ASP-Demo-Plan
3. Select Pricing tier:
 - **Free (F1)** – For learning/testing, limited performance
 - **Basic / B1** – Production entry level
 - **Standard / S1** – Autoscaling, suitable for real workloads
 - **Premium (P1v3)** – High performance enterprise workloads

For demo environments, **B1** or **F1** is fine.

5. Configure Other Tabs (Optional but Useful)

5.1 Deployment

You can enable:

- GitHub Actions
- Azure DevOps
- Bitbucket
- Local Git

Choose **Enable Continuous Deployment (Optional)** if using CI/CD.

5.2 Networking

- Enable **VNet Integration** if your app needs private resources.

5.3 Monitoring

- Application Insights (recommended)
- Choose **Enable**
- Select Region (should match App Service region)

5.4 Tags

Add metadata for cost management.

Example:

- Environment: Dev
 - Owner: San San
-

6. Review + Create

1. Click **Review + Create**.
2. Azure will validate your configuration.
3. Click **Create**.

Deployment takes 20–40 seconds.

7. Open the App Service

Once deployed:

1. Click **Go to Resource**.
2. On the overview page, you will see:
 - Default app URL
 - App Service Plan
 - Configuration options
 - Deployment center

Click the **URL** in the overview panel to confirm the app is running (you will see the default Azure page).

8. (Optional) Deploy Your ASP.NET Core API

You can deploy using:

- Visual Studio Publish
- Azure DevOps CI/CD
- ZIP deploy
- FTP
- GitHub Actions
- Docker Container Deployment

If you want, I can guide you **step-by-step to deploy your ASP.NET Core API using Visual Studio** after this.

Summary of Key Concepts

Component	Purpose
App Service	The web hosting environment
App Service Plan	Defines compute, region, pricing
Runtime Stack	Framework for your app (.NET, Node, etc.)
Region	Physical datacenter location
Application Insights	Monitoring and logging
